

A few clarifications for the project:

1) If an individual has more than one type of pain classification, create a category called multiple.

New categories for Type of Pain:

- Categories for table(s): Head; Neck; Chest; Abdomen; Back; Lower Extremity; Upper Extremity; Generalized; Multiple; Other

2) For provider type: there is an order of importance if more than one provider was listed. Physician/Attending trumps Intern/Resident trumps Midlevel. So if they saw all three, you would list Physician/Attending as the provider.

For Race/Ethnicity.

If an individual is classified as Hispanic, the individual should be labeled Hispanic. Otherwise if there is no Hispanic designation, but there is a race designation then the individual should be labeled that race. If there is neither designation, then they are missing or unknown.

For Pain.

For 2009: 0=None

1-3= Mild

4-6 = Moderate

7-10=Severe

Since it is difficult to visualize the output of the table 1 macro just within the results viewer, please use the file= option to create Word output.

Name the output for the first request file=one

The output for the second request file=two

and the output for the third request file=three.
